This sequence Natidation:
This sequence has been validated by Multiple Complete Digest
Mapping, Comparison of the experimentally derived map digest
fragments with sequence-predicted tengents is given below
small fragments below a variable cutoff (approximately 400-600bp)
are not mapped and hence do not appear in the table. There are no
significant remaining discrepancies between the experimental and
predicted values. Uniquely ordered fragment groups are separated
by dashed lines.

This entry has been annotated with sequence quality
estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero.
Quality levels above 40 are expected to have less than
a rico in 10,000 pp.
Base-by-base quality values are not generally visible from the
GenBank flat file format but are available as part
of this entry's ass. If ile.

consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as tuns of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                          consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NOTE: This is a 'working draft' sequence. It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ed.

on Jul 27, 1999 this sequence version replaced q1:5579004.
Outling sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variationa where differences are found these are annotated as variational rogether with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with conty a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databasea: numbers given in the feature table with their source databasea: Ems.; EmBL; Sw., SMISSPROT; Tr., TREMEL; Wp., WORMPEP; Information on the WORMPEP database can be found at his hear finished according to sequence map criteria as follows. An attempt is made to resolve all sequencement problems, such as compressions and repeats but not necessarily within known compressions and repeats equence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ineacute Ary.

This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 human chromosome 22, constructed by the Sanger Centre Chromosome 22 http://www.sanger.ac.uk/HGP/Chr22

http://www.sanger.ac.uk/HGP/Chr22

Cancer Institute by the group of pieter de Jong. For further Cancer Institute by the group of pieter de Jong. For further Cancer Institute by the group of pieter de Jong. For further Cancer Institute by the group of pieter de Jong. For further INF sequence is not the entire insert of clone 858B16. It may be shorter because we only sequence overlapping aections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone 694E4 (AL031255) is at 36572 in thia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HSJ858B16 18676 bp DNA B5BB16 on chromosome 22. Contains the Human DNA sequence from clone 858B16 on chromosome 22. Contains the KIAAO542 gene and a gene for a novel protein similar to hamster SSSC (Phosphatidylserine Decarboxylaae Proenzyme, EC 4.1.1.65). Contains ESTS, GSSs and a putative CpG island, complete sequence. ALO96768 ALO96768 TG:5596770 HTG: CpG Island; KIAAO542; Phosphatidylserine Decarboxylase Proenzyme; PSSC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. X04302) for increasing the stability of the fused protein as compexed to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: X04311-x04410; amino acid sequences W78126-W78225) which are useful for preventing, treating or ameliorating medical conditions es. 9. by protein or gene therapy. Also, pathological conditions on be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynelocides. Specific uses are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in (see X04311 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  v28846;

DNA encoding coxackie virus and adenovirus receptor - useful for modulation of e.g. cardiac, pancreatic or gastrointestinal infection problem of e.g. cardiac, pancreatic or gastrointestinal infection Disclosure Fig 14. 10pp; English.

The present sequence encodes mouse coxsackievirus and adenovirus creceptor (CAR). The present invention also describes: (1) a method for receptor (CAR). The present invention also describes: (1) a method for modulates CAR protein activity or CAR nucleic acid expression, which modulates CAR protein activity of the cell in the absence of the agent; and (2) a sociated activity of the cell in the absence of the agent; and (2) a comprising contacting a biological sample with an agent capable of detecting CAR protein or mRNA such that the presence of CAR is detected.

Comprising contacting a biological sample with an agent capable of detecting CAR protein or mRNA such that the presence of CAR is detected.

Comprising contacting a biological sample with an agent capable of detecting CAR protein or mRNA such that the presence of CAR is detected.

Comprising contacting a biological sample with an agent capable of central nervous system, e.g. a non specific febrile illnection of the central nervous system, e.g. a non specific febrile illnection of the respiratory or gastrointestinal tract or childhood onset diabetes mellitus. Probes derived from CAR nucleic acids are useful for hybridisation assays, and antibodies raised against CAR include combining CAR protein and a candidate/test compound are useful in screening for drugs which interact with CAR protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               712 ACGATCGCGGGCGCGTCATAGGGACGCTGCTGGCCCTTGTGCTCATCGGGGCCATCCTC 771

Claim 5. Fig 1; 88pp; English.

This cDNA sequence includes a coding region for a new member of the This cDNA sequence includes a coding region for a member of the This cDNA sequence includes a coding region of Tango-634 i.e.

Tango-63d and Tango-63e (see V62673), were identified in a human prostate conNA library through EST sequencing and screening. The encoded polypeptides are identical with the exception of the encoded polypeptides are identical with the exception of the encoded polypeptides are identical with the exception of the markers WI-6088 and WI-653. A plasmid encoding Tango-63d send -36. Vectors containing these markers WI-6088 and WI-653. A plasmid encoding Tango-63d and -36. Vectors containing these morbiding Tango-63d and -36. Vectors containing these nucleic acid molecules, calls harboring recombined DNA encoding and/or -63e, fusion proteins that include Tando-63d and/or -63e, fusion proteins that include Tando-63d and/or -63e, methods are provided for the diagnosis and treatment of disorders associated with either an abnormally high or an canormally low rate of apoptotic cell death. Inhibitors can be conformally low rate of apoptotic cell death. Inhibitors can be conformally low rate of apoptotic cell death. Inhibitors can be conformed by a can be used for treating e.g. canocers, autoimmune disorders (e.g. systemic viral infections (e.g. herpesytiuses, poxituses, and adenoviruses).

C used for treating e.g. canocers, autoimmune disorders (e.g. systemic viral infections (e.g. herpesytiuses, poxituses, and adenoviruses).

C used for treating e.g. canocers, autoimmune disorders (e.g. systemic viral infections (e.g. herpesytiuses) poxituses, and adenoviruses of e.g. Alzhehmer's disease, parkinson's disease, amyotrophic lateral schemia or toxin-induced injury. In addition, T cell myculated diseases, including Albabatos septic shock, cerebral malaria, graft rejection, cytotoxicity, cachexia, and inflammation cerebral and screening assays.

C diagnosis and screening assays.

Claim 43; Pege B1-82; 109pp; English.

CDNA (702964) coding for the mouse cell-cycle regulatory (CCR) protein p15 (RB5118) was isolated from an embryonal carcinomal library using a probe based on a mouse CCR p13; 5 cDNA (702965).

The isolated cDNA can be used: to detect mutations in CCR genes that lead to cell proliferation; to breed transgenic animals to study cellular disorders involving CCR allele mutation, missypression; and to correct CCR-deficient cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          V50430;

Claim 1: Page 1477; 2245pp; Japanese.
A single-stranded DNA (or its complementary strand or the corresp.
double-stranded DNA) which comprises one of the 7837 "GS" sequences
given in T19001-T26837 and which is able to hybridise to part of
human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed cDNA ibraries prepared
from various human tissues; synthesis of cDNA was initiated from the-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                119 ACTITIGCAACTGAAGCTGAAGGAGTCTTTTCTGACAAATTCCTCTATGAGTCCAGCTTC 178
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 18; Page 17-20; 35pp; Japanese.

Rample 18: Page 17-20; 35pp; Japanese.

074052 is interleukin-1-beta cDNA and 074019-21 are primers used for the amplification of this cDNA. They are used specifically for the detection and isolation of this sequence. The primers have the advantage of high sensitivity and reliability and are useful in the pharmaceutical industry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A primer for the detection and the determn. of a specific messenger RNA - can detect and determine specific mRNA(s) with high reliability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss. This sequence encodes a novel human tumour necrosis factor related receptor, TR6. TR6 polypeptides and polynucleotides can be used in the treatment of chronic and acute inflammation, arthritis, septicaemia, autorimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, infection, stroke, ischemmia, acute respiratory disease syndrome, restenosis, brain injury, (acquired autoimmune disease syndrome) AlbS, bone diseases, cancer (e.g. lympho-proliferative disorders), atherosclerosis and Alzheimers disease. Tango-77; human; IL-Ira; cytokine superfamily; inflammation; inhibition; interleukin-1 receptor; IL-IR; regulation; sathma: rheumatoid arthritis; chronic myelogenous leukemains; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untrastated sequence is unique to a particular mRNA species, almost all the 3'-criented const hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 287 BP; 63 A; 55 C; 73 G; 81 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4343 ACTCTACAGCTGGAGGTAAGTGAATGCTATGGAATGAAGCCCTTCTCAGCCTCCTGCTAC 4284

Claim 2; Fig. 3; 29pp; English.

A chord clone (7186795) codes for a novel radiation-protecting human checkpoint protein (894905), designated RAP-1, involved in requiration of cell cycle progression and/or apoptosis; It was captualtion of cell cycle progression and/or apoptosis; It was captualtion of cell cycle progression and/or apoptosis; It was captualtion of cell cycle progression and/or apoptosis; It was captualtion of cell cycle progression and immortalised in an immortalised captured progression and secret complemented UV sensitivity and was used to screen a captual progression or captured for early detection and prevention of tumour progression or can be used to design new drugs that enance radiotherapy or chemotherapy of diseases involving abnormal apoptosis.

provary, pituitary, retina and colon cDNA libraries
claim 1: page 210: 633pp; Engilah.

This sequence represents an expressed sequence tag (EST), and is a
rise contect of the invention. The polynucleotides of the invention are
colonical expressed sequences isolated from a variety of human tissue
sources. The EST sequences isolated from a variety of human tissue
cources. The EST sequences and proteins encoded by them are preditted to
treating, preventing or ameliorating medical conditions in humans and
animals, although no supporting data is given. Suggested activities
conditional activity, immune stimulating or suppressing activity,
cactivin/inhibin activity, chemotactic/chemokinetic activity,
activin/inhibin activity, receptor/ligand activity, anti-inflammatory
cactivity, cadherin/tumour invasion suppressor activity, tumour invasion suppressor activity, tumour invasion suppressor activity, tumour inhibition
activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Wer isolated Treponema pallidum nucleic acids - used to develop
New isolated Treponema pallidum nucleic scharacterisation, prevention
and therapy of T. pallidum infections, particularly syphilis
Claim 1; Page 661-672; 1150pp; English.
X50500-21243 represent polynucleotides sequences from the genome of
Treponema pallidum. The sequences can be used for detection,
diagnosis, characterisation, prevention and therapy for T. pallidum
infections, particularly syphilis. They can also be used for detecting
diseases related to Borrelia infections in animals, and for the
production of blosynchetic products such as enzymes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 3, Application US/08466390
Patent No. 5686562
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NOVEL MALIGNANT CELL TYPE MARKERS OF THE TITLE OF INVENTION: INTERIOR NUCLEAR MATRIX
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
MODRESSE: TESTA, HURWITZ & THIBEAULT
STREET: 125 HIGH STREET
CITY: BOSTON
US-08-750-357-8/c

| Sequence 8, Application US/08750357
| Patent No. 6006437
| Patent No. 6006437
| GENERAL INFORMATION:
| APPLICANT: WILLIAMS, Mark
| APPLICANT: WILLIAMS, Mark
| APPLICANT: WILLIAMS, MARK
| TITLE OF INVENTION: USE OF ANTHOCYANIN GENES TO MAINTAIN
| TITLE OF INVENTION: MALE STERILE PLANTS
| WUMBER OF SEQUENCES:
| CORRESPONDENCES:

The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized adult Lung library. CDNA Library Preparation: M. Fatima Bonaldo, Genetics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           used as a driver in a hybridization with the UT-R-CI
library in the form of single-granded circles. The
remaining slingle-stranded circles (subtracted library) was
purified by hydroxyapatte column chromatography,
converted to double-stranded circles and electroporated
into DH10B bacteria (Life Technologies) to generate the
UI-R-C2p library. This procedure has been previously
described (Bonaldo, Lennon and Soares, Genome Research 6:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       //ODCE="Vector: PT73D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I: Site_2: Eco R: Ist strand cDNA was prepared from human tonsillar cells enriched for germinal center B cells by flow sorting (CD20+, IGD-). Provided by Dr. Louis M. Staudt (NCI), Dr. David Allman (NCI) and Dr. Gerald Marit (CBER). CDNA synthesis was primed with a Not I - oligo(dT) primer. CDNA synthesis was primed with a Not I - oligo(dT) primer. Since CON I adaptors (Pharmacia), digested cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pr773 vector. Library went through one round of normalization, and was constructed by Berton Sories and M. Fatima Bonaido.

a modified polylanker; Site_I: Not I; Site_I: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI_CGAP_GCBI) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.G.E. clones 297480-302087, 692632-687239,
726408-72871, and 729086-731399, Subtraction by Bento
Soares and M. Fatima Bonaldo.
